

Client delivery workflow

Akshit Didla | Independent assessment-based design project

A consulting-firm workflow connecting referrals, LinkedIn and website enquiries to discovery, HubSpot, agreements, Asana, delivery and billing.

Problem and evidence

The supplied assessment scenario identifies inconsistent HubSpot logging. Missing handoff information, setup rework and billing delays are plausible risks to validate; the original transcript and operating data were unavailable.

Proposed operating model

Capture and assign lead > review discovery notes > validate CRM fields > approve scope and agreement > create one linked project > approve consultant assignment > review delivery updates > approve time and reconcile billing.

PRIORITY	DESIGN RESPONSE
First	Standardize fields, ownership and a signed-agreement handoff gate.
Next	Automate project setup and reminders with duplicate prevention and exception recovery.
Then	Pilot AI-generated summaries and status drafts with source checks and human approval.

Measurement and delivery

Six KPIs cover CRM completeness, handoff speed and quality, time submission, automation reliability and AI factual accuracy. Proposed gates include 95% CRM completeness and zero duplicate projects. Establish a two-week baseline, standardize and test in weeks 3-4, then run a four-week pilot. Targets are illustrative and unvalidated.

What this project demonstrates

Process mapping, structured requirements, handoff design, KPI definition and risk-aware automation planning. Deliverables include an eight-page case study, visual process comparison and a GitHub-ready README.

Scope and attribution

Based on the anonymized Business Workflow Analyst / AI Process Consultant assessment scenario. Independent portfolio work prepared with AI assistance; no employment or client engagement is implied. No live implementation, stakeholder validation or measured savings.
