

Client delivery workflow optimization & AI automation

Independent project | Process analysis and solution design

The problem

The supplied consulting-operations transcript describes inconsistent CRM capture, variable proposals, early starts, two assignment paths, fragmented status updates and late time entries delaying hourly invoices.

What I did

I mapped nine stages and their exceptions, documented ownership and information gaps, developed 15 follow-up discovery questions, and prioritized five improvement opportunities. I expanded the analysis into a future-state design, requirements, six KPIs and a pilot plan.

Priority	Recommendation
First	Agree capture ownership, setup rules, assignment reconciliation and hourly time cutoffs.
Next	Use a shared capacity view and record-level sources of truth across HubSpot, Asana and Drive.
Then	Pilot reviewed proposal and status drafts; use deterministic rules for capture and reminders.

How I would validate it

Collect a two-week baseline, standardize and test in weeks 3-4, then pilot one service type for four weeks. Separate hourly and fixed-fee billing. Measure completeness, readiness, reconciliation, status timeliness, invoice delays and total coordination effort.

Completed output, not claimed impact

The result is a documented process and proposed operating model. No live configuration, stakeholder validation or measured savings is claimed. Proposed targets require approval after baseline.
